GLOW PLUGS FOR ECOLOGICAL DIESEL ENGINES

UK

Diesel engines produce the highest amount of pollution during the first few minutes after starting.

If the glow plugs stay on during this short time, the temperature into the pre-chamber, or into the combustion chamber of a direct injection engine, remains at about 1.000°C allowing a better ignition and reducing the emission of polluting gasses by about 30 - 40%. The Directive n. 91-542/EEC of the 1st October 1991, has forced all the vehicles manufacturers to provide the new engines with specific controllers.

Our 'GENESIS' range of glow plugs has been developed to uniform to the EEC Directive and according to the parameters of the engines manufacturers for a quick Pre-heating (4 to 7 sec.) and Post-heating time (up to 180 sec. after starting at an average of 14V)

As a result, from an application point of view, this new generation of glow plugs, that we call GENESIS, can substitute all the older STANDARD models having the same dimension and without the post-heating phase.

All the glow plugs will be marked with the original rated Voltage, while the GENESIS can be marked with the battery Voltage (i.e. 12V or 24V) when their characteristics allow the replacement of more than one STANDARD reference.

In the Japanese engines the relays carry out a dual purpose:

- » 'Open' so to permit the pre-heating at the battery forward voltage (12V or 24V);
- » 'Pilot' during post-heating by means of the automatic insertion of a resistance that, after starting, reduces the current to the voltage marked on the glow plug.

In these circumstances the indication of the voltage on the glow plug does not imply a specific feature of the glow plug itself but the voltage the relay forwards during the post-heating to hold the temperature at 900/1000°C for a period of about 15 sec.

CANDELETTE DI PRE-POST RISCALDO PER MOTORI ECOLOGICI

ITA

I motori diesel producono il punto di massimo inquinamento atmosferico nei primi 3 minuti successivi all'avviamento.

Tenendo attivate le candele diesel durante questo periodo, la temperatura all'interno della Precamera, o nel caso dei motori ad iniezione diretta all'interno della camera di scoppio, sarà mantenuta a circa 1.000°C consentendo quindi una migliore combustione del carburante e riducendo del 30-40% l'emissione dei gas inquinanti. La direttiva CEE n°91-542 del 1 Ottobre 1991 ha imposto a tutti i costruttori di equipaggiare i nuovi motori destinati a circolare nella Comunità Europea con centraline che garantiscano queste prestazioni.

Abbiamo pertanto sviluppato il progetto GENESIS che ha portato alla produzione di una gamma di prodotti conformi alle esigenze della direttiva Europea ed ai parametri adottati dai costruttori dei motori sia nelle prestazioni di Pre-Riscaldamento Rapido (da 4 a 7 sec.), sia di Post-Riscaldamento prolungato (fino a 180 sec. dopo l'avvenuto avviamento con alimentazione media di 14 volts).

Dal punto di vista applicativo ne consegue che tutte le vecchie candele operanti con la sola funzione del Pre-riscaldamento, da noi denominate STANDARD, con le stesse dimensioni dei modelli GENESIS possono essere da questi rimpiazzati.

In questo catalogo le candele STANDARD riporteranno gli stessi Volts dei corrispondenti modelli originali;

Le candele GENESIS riporteranno gli stessi Volts dei corrispondenti modelli originali e, nei modelli nei quali possono sostituire diversi codici di uguali dimensioni, riporteranno il voltaggio nominale della batteria di alimentazione (12v o 24v)

Nei motori Giapponesi le centraline svolgono una duplice funzione:

- » "Libera" nel consentire l'azione di Pre-Riscaldamento con il pieno apporto della tensione della batteria;
- » "Pilota" nella funzione di Post-Riscaldamento tramite l'inserimento automatico di una resistenza che abbasserà, dopo l'avviamento, la tensione di alimentazione ai Volts riportati sulla candele.

In questi casi pertanto la dicitura della tensione riportata sulla candele non indica una caratteristica della candele stessa, bensì la tensione che la centralina abbinata erogherà in fase di Post-riscaldamento per mantenerla ad una temperatura di 900 / 1.000°C per un tempo di circa 15 sec.

BOUGIES DE PRECHAUFFAGE POUR MOTEURS DIESELS

FR

Le point de pollution le plus élevé dans les moteurs Diesels se produit pendant les premières minutes après le démarrage.

Si les bougies continuent à être allumées durant cette période de temps, la température dans la préchambre ou dans la chambre de combustion, dans le cas de moteurs à injection directe, se stabilisera à environ 1.000°C afin de permettre une meilleure injection en réduisant de 30-40% l'émission de gaz polluants. Le règlement n. 91-542/EEC du 1er octobre 1991 a obligé tous les constructeurs à équiper les moteurs avec des relais de préchauffage qui garantissent ces prestations.

Conformément à ce règlement et aux paramètres de Préchauffage (de 4 à 7 sec) et de Post-chauffage (jusqu'à 180 sec. après le démarrage à une tension moyenne de 14V) des fabricants de moteurs, nous avons développé la gamme de bougies 'GENESIS'.

Du point de vue de l'application il en résulte que nos bougies GENESIS peuvent remplacer toutes les anciennes bougies dénommées STANDARD qui ont les mêmes dimensions et la seule fonction de préchauffage.

Toutes les bougies seront marquées avec le voltage nominale d'origine sauf les bougies GENESIS qui seront marquées avec le voltage de batterie (12V ou 24V) quand il est possible de remplacer plusieurs modèles STANDARD.

Dans les moteurs Japonais le boîtier effectue une double fonction:

- » 'Libre' en permettant le préchauffage à la tension batterie (12V ou 24V)
- » 'Pilote' pendant le post-chauffage par l'insertion automatique d'une résistance qui, après le démarrage, réduit la tension au voltage indiqué sur la bougie.

Dans ces cas l'indication du voltage marqué sur la bougie de préchauffage n'indique pas une caractéristique de la bougie même, mais la tension que le relais distribue pendant le Post chauffage, afin de maintenir la température à 900/1000°C pour environ 15 sec.
